

### **Summary**

The invention concerns the method of establishing a communication connection between a calling subscriber terminal and a called subscriber terminal connected to a circuit switched communication network, a terminal for a communication network and a server for the provisioning of services to calling subscriber terminals of a circuit switched communication network. A calling subscriber enters a request to access a called subscriber terminal. The subscriber terminal transfers an identification of the called subscriber to a mediation function element. The mediation function element transmits said identification of the called subscriber to an address translation server. The address translation server transmits a circuit switched network address of a terminal of the called subscriber to the mediation function element. The mediation function element initiates a call establishment by passing said address to a call handling function of the circuit switched communication network.
